

DEVANSH MAUDGIL

Full-Stack Developer

devanshmaudgil18@gmail.com | 9817609921 | github.com/devanshmaudgil

PROFILE SUMMARY

Final-semester BCA (Cloud Technology) student with hands-on experience building complete, end-to-end client projects across web and mobile, including AI-integrated systems. Proven track record delivering production applications independently — from backend architecture and database design to native mobile apps — for both service-based and staffing/recruitment businesses. Proficient in AI integration and building with AI agents, using tools such as Cursor, Claude Code, and Emergent.sh.

WORK EXPERIENCE

Web Developer | RADiX INFINITEii

Present

- Built a complete Applicant Tracking System (ATS) from the ground up to manage the company's end-to-end recruitment and staffing workflow — from candidate sourcing through submission and placement.
- Designed candidate tracking, recruiter documentation, and pipeline management features that streamlined internal operations and reduced manual tracking overhead.
- Support day-to-day recruiting and business development operations, including candidate submissions, client outreach, and internal reporting.

Full-Stack Developer | Chary Services

Intern → Full-Time

- Built a complete vehicle audit system from scratch using Laravel and MySQL, covering backend audit tracking, management, and reporting for the organization.
- Led the migration of the entire system from Laravel to a React + MySQL stack to modernize the frontend and improve performance and maintainability.
- Developed a companion Flutter mobile app for field auditors to scan vehicle VIN stickers and capture audit data directly on-site, syncing all records to the central server in real time.

PERSONAL PROJECTS

Face Attendance Marker - Flutter, Dart, Google ML Kit, TFLite (MobileFaceNet), SQLite

- Built a kiosk-mode attendance app with live camera capture, on-device face detection and recognition, passive liveness checks, and Euclidean-distance matching.
- Implemented multi-pose enrollment, per-employee cooldown logic, and an admin dashboard with attendance history and PDF/CSV export via the Android share sheet.
- Secured admin access with hashed PINs and Flutter Secure Storage, and integrated native Android/Kotlin Lock Task Mode (Device Owner / COSU provisioning) for locked-down kiosk deployment.

LLM Model Comparison — AI F1 Simulation - Python, Pygame, Hugging Face Inference API

- Built a split-screen F1 racing simulation pitting Gemma-4 and DeepSeek-V4 against each other as autonomous drivers, using in-context crash memory (no fine-tuning) to learn track turns.
- Added ghost trails and a post-race metrics report covering finish time, crash count, latency, and learning curve across laps.

Hand Gesture Fruit Ninja - Python, OpenCV, MediaPipe, Pygame

- Built a real-time computer-vision game controlled entirely by index-finger slash gestures, using MediaPipe for hand tracking and OpenCV for rendering.

Automated Movie Ticket Booking Script - Python

- Built a Python automation script to handle end-to-end movie ticket booking without manual intervention.

TECHNICAL SKILLS

Languages & Frameworks: JavaScript, React, Node.js, PHP, Laravel, HTML, CSS, Flutter/Dart

Databases: MySQL, SQLite

Platforms & Tools: WordPress (Elementor), Git, GitHub

AI Integration & Agents: Proficient in AI integration and building with AI agents; experienced with Cursor, Claude Code, Emergent.sh, and similar tools

Specialization: End-to-end client project delivery with AI integration

EDUCATION

Bachelor of Computer Applications (BCA) — Cloud Technology
Kurukshetra University

2023 – 2026
